

## ABSTRACT OF THE INVENTION

A device and method for effecting movement, responsive to user input, of an  
5 object on a graphical display are disclosed. An input device comprises a component for  
capturing video images, an input image processor that generates an output signal  
responsive to motion from the video images, and an output image processor that is  
programmed to effect movement of the object on the graphical display in response to  
signals received from the input image processor. Various algorithms are employed  
10 within the input image processor to determine initial and derivative data that controls the  
movement of the object on the graphical display. In a preferred embodiment, video  
images are captured and processed to isolate a human form from a background, arm  
position and movement data are calculated from the human form, and a signal is  
generated responsive to this data for controlling the movement of an object, such as a  
15 bird, on a graphical display. The movement controlled on the graphical display can take  
the form of a moving object, or of the change of perspective that such an object might  
undergo, for example, a bird's eye view.
